Event Tool phase 2: Figma and flow Review

Invited Vikram Ravindra Lambe Sumit Garg prateek.malik@keysight.com sunny.gupta@keysight.com mukesh_satija@keysight.com Kush Dixit Vishal Raj Maurya

Attachments Event Tool phase 2: Figma and flow Review

Meeting records Recording

Summary

The team reviewed lead capture tool capabilities and finalized plans to integrate trade show API requirements.

Lead capture and integrations
The review covered current lead capture workflows and upcoming Eloqua integrations. Management agreed to include trade show API functionality to automate attendee classification.

Form structure and configuration
Discussions focused on standardizing form creation through templates and organizing data into 3 sections. The system will support 5 self-service integration options to reduce vendor dependency.

Execution and backend strategy
Data storage utilizes AWS S3 for media files with admin-controlled syncing intervals for external platforms. A backend wrapper will standardize responses to accommodate multiple vendors seamlessly.

Decisions

Aligned

- **Reception badge scan capability added** Incorporate badge scanning at the reception as a requirement in phase 2 in addition to existing booth badge scanning capabilities.
- **Business card AI capture included** Include AI-driven business card image scanning as a capability to auto-populate form fields when badge scan data is unavailable.
- **Standardized badge integration strategy adopted** Implement 3-5 standardized self-serve integration options for badge scanning (e.g., API, Excel upload, webhooks) rather than supporting individual vendor-specific API implementations.
- **Lead capture form structure defined** Structure the lead capture form into three expandable sections: Customer Information, Lead Capture (Send to Sales), and Schedule Meeting.
- **Landing page functionality added** Implement the capability to automatically convert lead capture forms into landing pages once enabled for a specific campaign.
- **Form review process implemented** Include an administrative form review and approval process for all new forms created within the system.
- **Mandatory event-first workflow established** Require the creation of an event prior to form creation to ensure proper association and capture of campaign metadata.

We've **updated the Decisions section** using your feedback.

Next steps

- ☐ [Kush Dixit] Add Reception Scanning: Add badge scanning capability at the reception for event attendees to the application scope.

- [ ] [Kush Dixit] Implement Integration Options: Build 5 self serve integration methods for badge scans, including API and manual upload options, as a standard tool capability.
- [ ] [Kush Dixit] Add Business Card Capture: Integrate business card image capture with Optical Character Recognition functionality into the AI and media components.
- [ ] [Kush Dixit] Redesign Lead Form: Restructure the form into 3 distinct sections covering customer information, lead capture, and meeting scheduling.
- [ ] [Kush Dixit] Create Form Review: Include a review and approval process for new forms created by managers or administrators.
- [ ] [Kush Dixit] Schedule Follow up: Schedule a follow up meeting to explain the badge scan and API integration scenarios to the team.
- [ ] [Kush Dixit] Refine Creation Workflow: Refine the event and form creation sequence to ensure a single, streamlined user journey.
- [ ] [Kush Dixit] Evaluate Landing Page: Evaluate the implementation of form landing page functionality for booth representatives.
- [ ] [Sunny Gupta] Review Figma: Examine the current design in the provided link. Provide constructive feedback to the developers to improve functionality.
- [ ] [Sunny Gupta] Get Team Review: Organize an internal review of the design with relevant colleagues. Communicate any identified gaps or feedback to the development team.
- [ ] [Kush Dixit] Study Scanning Options: Research alternative approaches for the badge scanning process. Propose viable solutions that improve upon current tool limitations.
- [ ] [The group] Schedule Follow-up: Coordinate a meeting for Friday or Monday. Discuss the remaining 4 options for the scanning implementation.
- [ ] [Sunny Gupta] Verify Reception Scanning: Consult with the team to clarify the scan at reception requirements. Communicate the findings to the developers.
- [ ] [Kush Dixit] Share Recording: Distribute the meeting recording to all participants.

Details

- **Event Management and Overview**: Kush Dixit introduces the current capabilities of the tool, including event management and scheduling via Microsoft Teams, authentication using Keysight library, and lead capture

workflows. They outline plans for phase two, which includes adding Eloqua integration and improved meeting management based on feedback from Sunny Gupta.

- **Trade Show API Capabilities**: Mukesh raises a concern regarding the absence of a trade show API capability, which would allow a customer's badge scan at a reception to automatically classify them as an attendee for the event campaign. Although Kush Dixit initially defends the current scope, they acknowledge the requirement after feedback from Mukesh and Sunny Gupta and agree to include it.
- **AI and Media Components**: The team discusses the inclusion of AI and media features in the lead capture form, such as audio recording and transcription. Sunny Gupta questions whether business card image capturing will auto-populate form fields, and Kush Dixit confirms that the OCR reader will be utilized to populate data if the badge scan does not provide information.
- **Badge Scan Integration Strategies**: Kush Dixit explains that the current badge scan relies on a single vendor, "scan-to-lead," using API tokens. Mukesh proposes that the system should offer five self-service integration options—such as API endpoints, Excel uploads, or webhooks—so that Keysight users are not dependent on specific vendors; Kush Dixit agrees to investigate these options.
- **Dashboard and Form Creation**: Kush Dixit demonstrates the dashboard where users can create new forms and associate them with events. They clarify that master forms exist where modifications are restricted to super-admins, and that users can associate specific lead capture forms with events during the event creation process.
- **Form Structure and Metadata**: Mukesh suggests that the form should be organized into three expandable sections: customer information, lead capture (sent to sales), and meeting scheduling. Kush Dixit confirms that campaign information is linked to the event in the backend, and Sunny Gupta agrees that the form should effectively function as a landing page.
- **Template and Field Configuration**: Kush Dixit shows how users can create forms from templates and designate mandatory fields using a red asterisk. Vishal Raj Maurya and Kush Dixit explain that during form creation, users can map fields and select scanner types, such as QR code, barcode, or NFC.
- **Audio and File Upload Storage**: Kush Dixit explains that audio recordings and file uploads are stored in an AWS S3 bucket, with the application displaying only the file name to the user rather than the full path. Prateek Malik confirms

that the data synced to Eloqua will include both the file name and a link to the media.

- **Event Creation Workflow**: The team discusses the sequence of creating events and forms, with Sunny Gupta emphasizing that event metadata is mandatory and should be set up first. Kush Dixit notes the need to design a smoother, singular user journey for these steps to prevent user confusion.
- **Execution and Scheduling Flow**: Kush Dixit demonstrates the lead capture flow, highlighting that users have the option to "submit" or "submit and schedule" a meeting. The system tracks captured leads and scheduled meetings, and users can view analytics, such as the total number of meetings scheduled, on the event detail page.
- **Data Syncing and Editing**: Users can edit pending leads, and bulk syncing to Eloqua can be configured for 12 or 24-hour intervals. Kush Dixit clarifies that this syncing capability is currently intended for admin access only.
- **Refining Reception Scan Requirements**: The group discusses the difference between scanning at the booth versus the reception. Kush Dixit admits the reception scan was not previously considered and commits to incorporating it into the scope, utilizing the proposed five-option integration plan.
- **Future Follow-ups**: Sunny Gupta and Kush Dixit agree to schedule a separate call to discuss the integration options further. Kush Dixit requests that the team review the Figma wireframes again to ensure all requirements are captured, while promising to study the additional API and integration capabilities.
- **Backend Implementation Strategy**: Kush Dixit explains that the team plans to develop a backend wrapper to standardize responses from various vendors, which will allow the system to handle multiple vendors without requiring constant changes to the frontend or backend logic.
